

## Pie

This is a Basic program for drawing pie charts on the hires screen of a CoCo 1 and 2. It must be run from a VDG screen and is thus compatible with OS9 level 1 Version 2. Make sure the Version 2 GRFO module is in memory.

After you input the values for the pieces and end the list with 9999 the graph is drawn on the hires screen. After the chart is displayed you can save it to disk by hitting the space bar. It is saved into the working directory as the file PIECHART.PIC, which can then be loaded into a graphics program like Illustrator or Deskmate for annotation and shading.

I have included both the source (pie.b09) and the runb executable file (pie). I have also included a utility from the rainbow called gsave which must also be in your CMDS directory. Make sure the attributes are set correctly (ATTR e pe) on the files pie and gsort.

Enjoy.
